

DOCKET NO.: CARP0015-100
APPLICATION SERIAL NO. 10/693,308
RESPONSE TO FINAL REJECTION DATED FEBRUARY 12, 2007

PATENT

AMENDMENT TO THE DRAWING

Please replace Figure 1 with the attached Replacement Sheet for Figure 1.

REMARKS

Claims 1-4, 7-8, 10-11, and 17-38 were pending in the present application. Claims 17-32 had been withdrawn from consideration pursuant to a Restriction Requirement. Claims 37-38 were withdrawn as being directed to non-elected subject matter. Claims 1, 3, 17-32, and 37-38 have been canceled herein. Claims 39 and 40 have been added. Upon entry of the present amendment, claims 2, 4, 7-8, 10-11, and 33-36 and 39-40 will be pending.

Preliminarily, Applicant thanks the Office for the helpful interview conducted on May 7, 2007, and for the Interview Summary dated as mailed June 1, 2007 ("the Interview Summary")¹. Pursuant to 37 C.F.R. § 1.133 (b), Applicant presents herein a complete written statement of the reasons presented at the interview as warranting favorable action. Three of the outstanding rejections were discussed during the interview: the rejection under 35 U.S.C. § 112, first paragraph for alleged lack of enablement; the rejection under 35 U.S.C. § 112, second paragraph for alleged indefiniteness; and the rejection under 35 U.S.C. § 102(b) for alleged anticipation by Ledbetter et al, WO 99/42077. It is Applicant's position that, if entered, the claim amendments submitted herein will overcome all of the foregoing rejections.

Specifically, regarding the rejection for indefiniteness, the claims have been amended to recite the method steps in an explicit manner, and to include a recitation specifying how the expression of heterologous VHH heavy chain locus specifically in B cells will be achieved, i.e., through the incorporation of a regulatory sequence providing for expression of the VHH heavy

¹ Applicant notes, however, that the copy of the Interview Summary received did **not** include a copy of the draft amendment, although the copy available on the Image File Wrapper through PAIR does.

chain locus specifically in B cells. Support for the positive method steps is implicit from the claims as originally filed; support for the recitation regarding B cell expression can be found, *inter alia*, on page 22, line 19 through page 23, line 14, of the application as filed.

Regarding the rejection for anticipation, although Applicant had initially submitted claim amendments reciting that there is more than one V, D, and J region in the heavy chain locus, upon further consideration, and review of the Interview Summary, Applicant has determined that these recitations are unduly restrictive. The Interview Summary states that the proposed amendment reciting the additional step of a regulatory sequence providing expression of VHH heavy chain locus specifically in B cell would overcome the rejection under 35 U.S.C. 102 (b) by Ledbetter et al. Further, Ledbetter et al. does not disclose or suggest a VHH heavy chain locus wherein the VHH region, the D region and the J region are capable of recombining, as recited in claim 2. The VHH heavy chain locus in Ledbetter et al. was obtained from a camelid and, thus, it does not have VHH, D, and J regions capable of recombining. For purposes of clarification, however, the word "region" has been changed to "exon" in claims 2 and 4, and claims 7 and 8. Both terms are used interchangeably in the specification, but the latter term is more accurate. (See, for example, page 9, lines 24-29 -- "A 'VHH exon/region' in the context of the present invention describes a naturally occurring VHH coding sequence . . .")

It is Applicant's belief that the foregoing amendments also address the rejection for lack of enablement, in conjunction with the arguments advanced during the interview, as discussed herein. It became apparent during the interview that the Office was of the view that the Janssens et al. reference, cited in the previous response to support enablement, was limited to the situation

in which an IgM knock out mouse is used, and the Office further asserted that such animals are not disclosed in the specification. Accordingly, the Office took the position that the claims were not enabled. As was pointed out during the interview, however, the Janssens et al. reference is not limited to the situation in which an IgM knock out mouse is used. Specifically, see the sentence bridging columns 1-2 on page 15132, emphasis added, – “Moreover B220/CD19-positive BM cells of GΔ line 1 transgenic mice in a **WT** background . . .”

Regardless, there is ample disclosure in the present specification regarding the use of knock out mice. See, for example, page 8, lines 10-14, wherein the deletion or silencing of the heavy chain loci endogenous to the mammal is disclosed, citing various references; page 28, lines 23-28, wherein it is stated that it is preferred that the recipient animal may be a “knock out” animal that is capable of having one or more of the genes required for the production of antibodies with light chains turned off or suppressed; and page 24, lines 2-3, wherein the inactivation of the endogenous locus is disclosed. Although these recitations do not specify that the animal be an IgM knock out, IgM knock out mice are specifically disclosed in Figure 1 of the application as filed.

It also became apparent during the interview that the Office was not convinced that Applicant had described how to prepare the (transgenic) non-human mammals as recited in claims 2 and 4. Initially, the Office took the position that the method of preparing the animals needed to be recited in the claims. The Office was reminded, however, that “[o]ne does not look to the claims but to the **specification** to find out how to practice the claimed invention.” MPEP § 2164.08, citing *W.L. Gore & Assoc., Inc. v. Garlock, Inc.*, 721 F.2d 1540, 1558, 220 USPQ

303, 316-17 (Fed. Cir. 1983), emphasis added. Thus, it is Applicant's position that the actual steps for preparing the animals do not need to be recited in the claims. As discussed in more detail below, the specification amply discloses the method for preparing animals as reported in Janssens et al.

In addition to the foregoing amendments, two new claims are submitted for consideration – claims 39 and 40. In view of the foregoing cancellation of claims, the net number of claims has not increased. Support for new claim 39 can be found, *inter alia*, on page 8, line 6. Support for new claim 40 can be found, *inter alia*, on page 23, lines 12-13.

Other amendments have been made for clarity, to change dependencies, or to include recitations from other claims.

The foregoing amendments were not made previously as the relevance of some did not become apparent until the Final Rejection, and the relevance of others did not become apparent until the interview.

Although Applicant believes the foregoing amendments have overcome the outstanding rejections, the rejections will be addressed below.

Preliminarily, the Office requested a corrected Figure 1 labeled correctly. A Replacement Sheet for Figure 1, labeled appropriately, is attached to this response. Further, Applicant notes with appreciation the withdrawal of the objection to the specification and the withdrawal of the provisional rejection for double patenting. Applicant also notes with appreciation the withdrawal of the rejections over Longberg et al. and Riechmann et al. and over Longberg et al. and Riechmann et al., further in view of Green et al.

Rejection Under 35 USC 112, first paragraph

Claims 1-4, 7-8, 10-11, and 33-36 were rejected under 35 USC 112, first paragraph, as allegedly failing to comply with the enablement requirement. Claims 1 and 3 have been canceled. Claims 39 and 40 have been added. To the extent this rejection is applied against the present claims, Applicant submits the following.

As an initial matter, the Office again stated that “the specification provides **only prophetic** and a general methodology without disclosing any specifics.” (*See* Final Rejection, page 5, emphasis added.) This statement is not only inaccurate, but it also misstates the requirement for enablement. First, the specification does provide specifics, to the degree needed to practice the invention. See the discussion of Janssens et al. below. Second, working examples are not required.

Compliance with the enablement requirement of 35 U.S.C. 112, first paragraph, does not turn on whether an example is disclosed. An example may be "working" or "prophetic." A working example is based on work actually performed. A prophetic example describes an embodiment of the invention based on predicted results rather than work actually conducted or results actually achieved.

MPEP § 2164.02, emphasis added.

Once again, the Office asserted three aspects it considered broad: the breadth of subject population for expressing VHH heavy chain locus; any vector comprising any promoter or locus

control region for expressing VHH specifically in B cells; and using ES cells of any species and expressing VHH locus. Regarding the first aspect, the Office relied upon De Genst et al. to support its position. The Office asserted that the teaching of De Genst et al. suggest that the mechanism of pre B cell maturation for the production of VHH single heavy chain was not known, and that it was not apparent from the specification whether a method as recited in the claims would result in a fully functional IgG molecule. As discussed during the interview, however, De Genst et al. has been countered by Janssens et al. As set forth more clearly below, Janssens et al. followed the procedures set out in the specification. Additionally, as discussed during the interview, at the time of filing, it was known that certain regulatory elements, i.e., LCRs, function across species. See, U.S. Patent No. 5,770,398. Applicant respectfully submits that, at the time of filing, in light of the specification, one of ordinary skill in the art could have practiced the claimed method in any non-human mammal, without undue experimentation.

Regarding the second aspect, the Office relied upon Keefer and Hammer et al., focusing upon the differences in levels of expression and the resultant phenotype depending upon the promoter used. As also discussed during the interview, however, these references are not relevant to the present invention. Applicant is not seeking a similar phenotype; all that is needed is sufficient antibody production for isolation.

Regarding the third aspect, as Applicant stressed during the interview, it is not necessary to use ES cells. As reported in Janssens et al., fertilized eggs can be used. Thus, the argument that ES technology is limited to mice is irrelevant.

During the interview, it became apparent that the Office was not convinced that

Applicant disclosed the same process used in Janssens et al. to prepare the animals in his specification. To assist the Office in its assessment, Applicant is duplicating the portion of the paragraph regarding Janssens et al. submitted with the previous response addressing preparation of the animals, but including citations to Applicant's application as filed. Specifically, the cited paper discloses the expression of loci containing IgM and IgG, and IgG only (page 7, line 21, through page 8, line 3), human constant regions (Figure 1 and page 11, lines 1-11), lacking CH1 (page 11, lines 9-11 and page 24, lines 17-20), with two camelid VHH regions, and human D and J regions (page 12, lines 13-19) in mice (page 28, line 3). Bac clone 11771 and pFastBac were both used successfully (page 22, lines 4-5). The loci further contained FRT and LoxP sites (page 21, lines 16-19), and immunoglobulin LCR (page 23, lines 12-14). The vectors were injected into fertilized mouse eggs of animals (page 27, lines 24-30) that do not produce surface IgM and have a block in B cell development at the pre-B cell stage (*see* page 28, lines 23-28 and Figure 1), and in wild type mice (page 27, lines 21-23).

Another one of the Office's repeated concerns has been "the random nature of transgene insertion" (*see* page 12 of the Final Rejection) and its effect on expression. As discussed during the interview, however, one can achieve position independent expression through the use of, for example, LCRs. See, U.S. Patent No. 5,770,398. LCRs are not, however, required. Without LCRs, the technology will still work, expression is less efficient and more variable, and more animals may need to be screened. Applicant submits that such is not undue experimentation but, rather, routine for one of ordinary skill in the art.

The test is not merely quantitative, since a considerable amount of

experimentation is permissible, if it is merely routine, or if the specification in question provides a reasonable amount of guidance with respect to the direction in which the experimentation should proceed.

MPEP § 2164.06, citing *In re Wands*, 858 F.2d 731, 737, 8 USPQ2d 1400, 1404 (Fed. Cir. 1988) (citing *In re Angstadt*, 537 F.2d 489, 502-04, 190 USPQ 214, 217-19 (CCPA 1976)).

Another concern that came out in the Interview Summary is the effect of copy number on transgene expression. But, such had already been addressed by the art at the time of filing of the present application. See, for example, the discussion on page 21, lines 20-23, of the application as filed, which discusses the use of FRT sites to allow production of single copy transgenics. Although using micro-injection in fertilised eggs to generate transgenic animals does not allow precise control of the number of copies of the transgenic locus that will be inserted, it was well known in the art as of the priority date of this application that injection of low concentrations of the DNA into the fertilized eggs favors single copy or low copy number integrations. See, for example, Strouboulis et al., *Genes and Development*, 6:1857-1864, 1992, page 1861, column 2, last sentence of first paragraph (copy enclosed). Although the Li et al. and Strouboulis et al. references are being submitted after final, Applicant has included a form PTO/SB/08b listing both and requests that the Office mark the same as being considered.

Further, if LCRs are used, each copy contains an LCR and would be expressed at normal levels. In the case of most genes, this could lead to an overexpression of the gene(s) in the transgenic animal. For the Office's convenience, Applicant has included a copy of a review of

LCRs, published in October, 1999 (i.e., well before Applicant's priority date) – Li et al., "Locus control regions coming of age at a decade plus," *TIG*, 15(10);403-408, 1999. As is clear from this review, expression with LCRs is copy number dependent, i.e., the greater the copy number, the greater the expression (see page 404, column 2). Applicant notes, however, that in the case of the immunoglobulin loci, the copy number is not particularly relevant because of the nature of the immune response. Once a productive VDJ recombination takes place the recombination process is stopped and only one of the loci is expressed. In multicopy transgenic mice where two loci are in tandem at the same site of insertion, then both loci can rearrange productively (i.e., copy number dependent) resulting in a single B-cell producing more than one antibody. Since the precise VDJ recombination and affinity maturation events are unique the antibodies produced are different. Where single loci have different sites of insertion, then allelic exclusion determines that there is only a single productive event resulting in the preferential expression of one locus relative to the rest. (See Janssens et al 2006, column 1, page 15132, through column 1, page 15133, section entitled "Multiple Rearrangements and Allelic Exclusion.") The evidence that copy number is indeed not relevant in the heavy chain only antibody transgenic mice was obtained by building in recombination sites that allowed the conversion of a five copy animal into a single copy animal. Heavy chain only antibodies are produced equally effectively in these animals, which carry the multicopy or single copy locus at the same insertion site (see Janssens et al., 2006, column 1, page 15131, through column 1, page 15132, section entitled "Chimeric Loci Lacking a Human CH1 region," as well as the section referenced above).

Applicant respectfully requests that this rejection be withdrawn.

Rejection Under 35 USC 112, second paragraph

Claims 1-4, 7-8, 10-11, and 33-36 were rejected under 35 USC 112, second paragraph as allegedly being incomplete for omitting essential steps. Specifically, the Office noted that the steps of how expression of heterologous VHH heavy chain locus specifically in B cells of the nonhuman mammal would be achieved were missing. Claims 1 and 3 have been canceled. Claims 2 and 4 have been amended to recite that the locus contains a regulatory sequence providing for expression of the VHH heavy chain locus specifically in B cells, and to positively recite the method steps of immunizing the animal and isolating antibody. The former amendment was submitted with the proposed amendment. The Interview Summary indicates that the recitation submitted with the proposed amendment would overcome this rejection.

Applicant respectfully requests that this rejection be withdrawn.

Rejection Under 35 USC 102

Claims 1-2 were rejected under 35 USC 102(b) as allegedly anticipated by Ledbetter et al (WO 99/42077). Claim 1 has been canceled. Claim 2 recites that the locus contains a regulatory sequence providing for expression of the VHH heavy chain locus specifically in B cells and that “the VHH region, the D region and the J region are **capable of recombining** to form VDJ coding sequence.” Neither limitation is disclosed or suggested by Ledbetter et al. Ledbetter et al. describes the isolation of an already recombined VHH locus. Indeed, in the Interview Summary, the Office acknowledged that the first amendment would overcome this rejection.

Applicant respectfully requests that this rejection be withdrawn.

Rejection for Obviousness-type Double Patenting

Claims 1-4, 7-8, 10-11, and 33-36 were provisionally rejected for obviousness-type double patenting in view of claims 1, 3, 7-8, 10-11, and 33-36, of copending Application No. 10/692,918. Claims 1 and 3 have been canceled. Claims 39 and 40 have been added. To the extent this rejection is applied against the present claims, Applicant advises that a terminal disclaimer will be filed upon an indication that the claims are otherwise allowable.

The Office listed four references as not relied upon but considered pertinent to Applicant's disclosure. Two references have already been cited in rejections which have been withdrawn. Applicant reserves the right to comment on these references if, and when, they are relied upon by the Office.

APPLICATION SERIAL NO. 10/693,308

RESPONSE TO FINAL REJECTION DATED FEBRUARY 12, 2007

CONCLUSION

Applicant respectfully submits that claims 2, 4, 7-8, 10-11, 33-36, and 39-40 are in condition for allowance. An early notice of the same is earnestly solicited. The Examiner is invited to contact Applicants' undersigned representative at (215) 665-5593, if there are any questions regarding Applicants' claimed invention.

Respectfully submitted,

/Doreen Yatko Trujillo/
